85.909 Acres MOL

**Row Crop Land with Hunting & Homesite Potential
Troy, Falls County, TX 76579**

Property Highlights

Location – TBD CR 459 Troy, Falls County, TX. Strategically located just 35 minutes from Waco, 1 hour 15 minutes from Austin, and 2 hours from Fort Worth, this 85.9-acre tract in Falls County offers turnkey agricultural income, recreational value, and residential potential — all with excellent access to I-35 (just 5.5 miles away).

Acres – 85.909 Acres MOL according to Falls County Appraisal District.

Investor Highlights

- **Productive Soil & Gentle Terrain:** The land is predominantly flat with light rolling features and a mix of soil types suited for a variety of crops.
- **Future Homesite Ready:** Ideal for a rural homestead, weekend getaway, or long-term hold. Water and electric are available nearby, making future development straightforward.
- **Recreational Use:** A natural central section of the property offers excellent cover for hunting, and there's a small wet-weather pond that could be expanded for added wildlife or livestock use.
- **Growth Market:** This area of Falls County is seeing increasing interest from green energy developers and land investors, suggesting long-term appreciation upside.
- **Utilities:**
 - **Water:** Cego Durango Water Supply Corporation services the area. No meter currently installed.
 - **Electricity:** Oncor Electric Delivery services the area; no current meter.
- **Access:** Private and quiet but easily reached just minutes from I-35.
- **Minerals:** No minerals will be conveyed.
- **Legal & Easements:** Buyer should confirm easements via title work.
- **Shown by** appointment only.

**Row Crop Land with Hunting & Homesite Potential
Troy, Falls County, TX 76579**

Soil Type – 13

13—Branyon clay, 0 to 1 percent slopes. This deep, moderately well drained, nearly level soil is on narrow terraces along major streams. Slopes are smooth. Areas range from 15 to 500 acres in size.

This soil has a surface layer of very dark gray, moderately alkaline clay about 48 inches thick. Below the surface layer, to a depth of 66 inches, is dark gray, moderately alkaline clay. The underlying layer, to a depth of 80 inches, is grayish brown, moderately alkaline clay that has brown mottles.

This soil is sticky when wet and is difficult to work. When it is dry, it is hard and clods when plowed. Dense plowpan layers are common in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but penetration by plant roots is restricted by the clayey lower layers. Runoff is slow. The hazard of water erosion is slight.

Included with this soil in mapping are small areas of Houston Black, Heiden, and Lewisville soils. The Houston Black and Heiden soils are on uplands. The Lewisville soils are on steeper side slopes. The included soils make up 10 to 20 percent of this map unit.

This soil is used mainly for crops. The potential for this use is high. The major crops are cotton and grain sorghum, but corn and small grain are also grown. The major objectives in management are maintaining tilth and providing adequate surface drainage. Proper management includes growing crops that produce large amounts of residue and maintaining smooth surface gradients.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Proper pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along drainageways.

This soil has low potential for most urban uses. Limitations that affect urban development are shrinking and swelling with changes in moisture, low strength, corrosivity to uncoated steel, and slow percolation. Potential for recreation is low. The clayey surface layer and very slow permeability are the most restrictive limitations for this use. Potential for both openland and rangeland wildlife habitat is medium. Capability subclass IIw; Blackland range site.

85.909 Acres MOL

**Row Crop Land with Hunting & Homesite Potential
Troy, Falls County, TX 76579**

Soil Type –29

29—Heiden clay, 1 to 3 percent slopes. This deep, well drained, gently sloping soil is on narrow ridges and foot slopes of the uplands. Slopes are convex. Areas are long and are narrow to broad. They range from 10 to about 120 acres in size.

This soil has a surface layer of dark grayish brown, moderately alkaline clay about 21 inches thick. Between depths of 21 to 45 inches is grayish brown, moderately alkaline clay that has light yellowish brown mottles. The underlying material, to a depth of 80 inches, is yellow, moderately alkaline shaly clay.

This soil is difficult to work. When wet, it is sticky; when dry, it is hard and clods when plowed. Dense plowpan layers are common in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but penetration by roots is slow. Runoff is medium. The hazard of water erosion is moderate.

Included with this soil in mapping are small areas of Houston Black, Branyon, and Trinity soils. The Branyon soils occupy stream terraces and the Trinity soils are on flood plains. Houston Black soils are intermingled irregularly. The included soils make up 10 to 20 percent of this map unit.

This soil is used mainly for crops. The potential for crops is high. Cotton and grain sorghum are the main crops, but corn and small grain are also grown. The main objectives of management are controlling erosion and improving tilth. Terracing and growing crops that produce large amounts of residue help control erosion and maintain tilth.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Proper pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along drainageways.

This soil has low potential for most urban uses. The limitations that affect urban development are the shrinking and swelling with changes in moisture, corrosivity to uncoated steel, and slow percolation. The potential for recreation is low. The most restrictive limitations for this use are the clayey surface layer and the very slow permeability. Potential for openland wildlife habitat is medium, and potential for rangeland wildlife habitat is low. Capability subclass IIe; Blackland range site.

Troy, Falls County, TX 76579**

Soil Type –30

30—Heiden clay, 3 to 5 percent slopes. This deep, well drained, gently sloping soil is on uplands. Slopes are convex. Areas are long and narrow and range from 5 to 20 acres in size.

The surface layer of this soil, to a depth of 20 inches, is dark grayish brown, moderately alkaline clay. Between depths of 20 and 41 inches is olive, moderately alkaline clay. The underlying layer, to a depth of 80 inches, is yellow, moderately alkaline clay that has olive yellow mottles.

This soil is difficult to work. When wet, it is sticky and plastic; when dry, it is hard and clods when plowed. Dense plowpan layers are common in cultivated areas. The permeability is very slow, and the available water capacity is high. The root zone is deep, but penetration by roots is slow. Runoff is slow. The hazard of water erosion is moderately severe.

Included with this soil in mapping are small areas of Ferris, Houston Black, Burleson, and Trinity soils. The Ferris soils occupy gullies and steeper side slopes. The Houston Black and Burleson soils are on less sloping parts of the landscape and the Trinity soils occupy flood plains. The included soils make up 10 percent of this map unit.

This soil is used about equally for crops and pasture. It has medium potential for production of crops, but it is limited by slope. Grain sorghum, cotton, and small grain are the main crops. The main objectives of management are controlling erosion and improving tilth. Terracing and growing crops that produce large amounts of residue help control erosion and maintain soil tilth.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along drainageways.

This soil has low potential for most urban uses. The limitations that affect urban development are the shrinking and swelling with changes in moisture, corrosivity to uncoated steel, and slow percolation. The potential for recreation is low. The clayey surface layer and the very slow permeability are the most restrictive limitations for this use. Potential for openland wildlife habitat is medium, and potential for rangeland wildlife habitat is low. Capability subclass IIIe; Blackland range site.

85.909 Acres MOL

**Row Crop Land with Hunting & Homesite Potential
Troy, Falls County, TX 76579**

Soil Type –31

31—Heiden clay, 2 to 5 percent slopes, eroded. This deep, well drained, gently sloping soil is on uplands. Most areas are rilled and have shallow gullies that are 100 to 200 feet apart. Slopes are convex. Areas are long and narrow and range from 10 to about 80 acres in size.

This soil has a surface layer of dark grayish brown, moderately alkaline clay about 17 inches thick. Between depths of 17 and 43 inches is grayish brown, moderately alkaline clay. The underlying layer is light yellowish brown, moderately alkaline clay.

This soil is difficult to work. When wet, it is sticky and plastic; when dry, it is hard and clods when plowed. Dense plowpan layers are common in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but penetration by roots is slow. Runoff is rapid. The hazard of water erosion is moderately severe.

Included with this soil in mapping are small areas of Ferris soils. This soil occupies shallow gullies and adjoining slopes. This soil makes up about 18 percent of this map unit.

Some areas of this soil are still cultivated, but most areas are now in pasture. This soil has medium potential for production of crops, but it is limited for this use because the surface layer has been eroded away. Grain sorghum, cotton, and small grain are the main crops. The main objectives of management are controlling erosion and improving tilth. Terracing and growing crops that produce large amounts of residue or deep-rooted legumes help control erosion and maintain tilth.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along the drainageways.

This soil has low potential for most urban uses. Its most restrictive limitations are shrinking and swelling with changes in moisture, corrosivity to uncoated steel, and slow percolation. The potential for recreation is low. The clayey surface layer and the very slow permeability are the most restrictive limitations for this use. Potential for openland wildlife habitat is medium, and potential for rangeland wildlife habitat is low. Capability subclass IIIe; Blackland range site.
